CDNA Library Preparation: Life Technologies, Inc.

```
And-most vector: DCMV-SPORT6; Site_1: NotI; Site_2: ECORV (destroyed): RNA source leukocytes from anonymous pool of non-activated adult donors. Library is oligo-dr primed and directionally cloned (ECORV site is destroyed upon cloning). Average insert size 1.7 kb, insert size range lil.2-3.3 kb. Library is normalized and enriched for full-length clones and was constructed by C. Gruber (invitrogen). Research Genetics tracking code 027. Note:
             DNA Sequencing by: Incyte Genomics, Inc.
Clone distribution: MGC clone distribution information can be found through the I.M.A.G.E. Consortlum/LLNL at:

Anote-Torgan: pooled lung and spleen; Vector: pCMV-SPORT6; Anote-Torgan: pooled lung and spleen; NeA source site_1: Not1; Site_2: EcoRV (destroyed); RNA source anonymous pool of 24 week female lung, 16 week female anonymous pool of 22 week male spleens. Library is oligo-dr primed and directionally cloned (EcoRV site is destroyed upon cloning). Average insert size 1.4 kb, insert size upon cloning). Average insert size 1.4 kb, insert size in ange 1.3 kb. Library is normalized and enriched for fange ill-length clones and was constructed by C. Gruber (Invitrogen). Research Genetics tracking code 026. Note:

Isolated polypeptides useful for treating anti-inflammatory diseases, nervous system disorders, and for regenerating bone and cartilage -

Claim 1; Page 748-749; 894pp; English.

The invention relates to polynucleotides encoding novel human proteins or their active domains. The polypeptides, polynucleotides and treatment of a mammal and prevention of disorders caused by the aberrant conjecture weight markers, food supplements, and in antibody production. Polypeptides are used to identify compounds which bind to the polypeptides are used to identify compounds which bind to the primers. For sequencing, for chromosome or gene mapping, in the production of recombinant proteins, and in generating anti-sense DNA or exerging the sequencing. Polypeptides of the invention are used as probes and production of recombinant proteins, and in generating anti-sense DNA or carget drugs to a tumour, in assays to determine biological activity, to protein levels, as tissue markers, and to isolate receptors or ligands. Contraceptives of the invention may also be useful in treating platelet ingament and/or nerve tissue, wound healing, treating burns, promoting contraceptive, treating osteoporosis and osteoarthritis, anamemia, contraceptive, treating osteoporosis and osteoarthritis, anamemia, contraceptive, treating osteoporosis and osteoarthritis, anamemia, contraceptive, treating osteoporosis and osteoarthritis, anamemia, contraceptive, treating osteoporosis and osteoarthritis, anamemia, contraceptive, treating osteoporosis and osteoarthritis, anamemia, contraceptive, treating osteoporosis and osteoarthritis, anamemia, contraceptive, treating osteoporosis and osteoarthritis, anamemia, contraceptive, treating osteoporosis and osteoarthritis, thrombosis, attume, fungal infection or from autoimmunity, cancer, allergy, astimm, contraceptive, treating osteoporosis and osteoarthritis, thrombosis, and infection.

The present sequence encodes a protein of the invention.

Sequence 1520 BP; 380 A; 393 C; 351 G; 396 T; 0 other;

The present sequence is a cDNA encoding human receptor-associated protein (HRAP) from Incyte clone 1361202 obtained from LUNGNOT12 cDNA library. This sequence is expressed in haematopoietic/Immune, gastrointestinal and reproductive tissues. HRAP has cytostatic, immunomodulatory, antiinflammatory, cardiant, antiarteriosclerotic, hepatotropic, antiarthritic, antiinheumatic, osteopathic, antiallergic, antianaemic, antiatheratological and neuroprotective activities. The present sequence is useful in the diagnosis, treatment and prevention of disorders associated with HRAP expression, especially cell proliferative, autoimnune/inflammatory, reproductive.
          neuroprotective; diagnosis; treatment; prevention; reproductive disorder; cardiovascular; cell proliferative; autoimmune; inflammatory; allergy; gastrointestinal; atheroscherosis; cirrhosis; leukaemia; cancer; AIDS; arthritis; anaemia; asthma; dermatitis; diabetes; osteoporosis; multiple sclerosis; irritable bowel syndrome; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New human receptor-associated proteins (HRAP) useful for the diagnosis, treatment and prevention of cell proliferative, autoimmune, inflammatory, reproductive, cardiovascular, and gastrointestinal

The present invention relates to the isolation of novel cDNA sequences which encode human secreted proteins. The cDNA sequences have been carlved from a variety of human tissues. The invention also provides to proteins are useful for teaching from these polynucleotide sequences. The proteins are useful for identifying compounds that modulate their compounds that modulate expression of the polynucleotide sequences. CC compounds that modulate expression of the polynucleotide sequences concoding the secreted proteins. The sequences of the invention are useful for treating diseases such as hyperproliferative disorders concerp, immune deficiency disorders (e.g. severe combined concerp), blood disorders (e.g. thrombocytopaenia), inflammatory controleotide sequences of the invention are also useful in gene and the polynucleotide sequences of the invention are also useful in gene and the control and the control and secret the control and secret in much sequences of the invention are also useful in gene and the control and the control and the control and the control and the control and the control and the control and the control and the control and the control and the control and the control and the control and the control and the control and the control and the control and the control and the control and the control and the control and the control and the control and the control and the control and the control and the control and the control and the control and the control and the control and the control and the control and the control and the control and the control and the control and the control and the control and the control and the control and the control and the control and the control and the control and the control and the control and the control and the control and the control and the control and the control and the control and the control and the control and the control and the control and the control and the control and the control and the control and the control and the control and the control and the cont

Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis -

```
AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I) amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic proteins and can be used in gene therapy and vaccine production. (I) treatment of diseases associated with inappropriate (I) expression. For expression by rectifying mutations or deletions in a patient's genome supplement the patients own production of (I). Additionally, (I) polynucleotides may be used to treat disorders associated with decreased supplement the patients own production of (I). Additionally, (I) polynucleotides may be used to produce the secreted (I), by inserting protein. (I) proteins and polynucleotides may be used to produce the secreted (I), by inserting protein. (I) proteins and polynucleotides may be used to prevent, and dispasses and treat immune/haematopoietic-related diseases, especially
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                           cancers and cancer metastases of haematopoietic-derived cells. AAK64703 to AAK87694 represent human immune/heematopoietic antigen genomic sequences from the present invention. AAK54942 to AAK54950 and AAM82169 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             964 CGAATTTATGATTAAGATTGCTGAAGAGCTGCCAAACACTGCTGCCACCCCCTCTGTTCC 1023

AAN60079 was generated from the Jurkat human leukaemia T cell line. It is contained in T cell clone pY14. The labelled nucleic acid and monocLonal or polyclonal antibodies to the polypeptides may be used to determine whether unknown cells, e.g. tumour cells, are T cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence encoding a polypeptide which is at least part of the alpha chain of T cell antigen receptor.

rhe invention relates to polynucleotides encoding novel human proteins or their active domains. The polypeptides, polynucleotides and proteins or their active domains. The polypeptides, polynucleotides are are used in a method of attribodies raised against the polypeptides can be used as protein expression or activity. The polypeptides can be used as protein expression or activity. The polypeptides can be used to identify compounds which bind to the polypeptides are used to identify compounds which bind to the polypeptides are used to identify compounds which bind to the polypeptides of the invention are used as probes and polypeptides of the invention are used to production of recombinant proteins, and in generating anti-sense DNA or production of recombinant proteins, and in generating anti-sense DNA or production of recombinant proteins, and in generating anti-sense DNA or production of recombinant proteins, and in generating anti-sense DNA or target drugs to a tumour, in assays to determine biological activity, to target drugs to a tumour, in assays to determine biological activity, to target drugs to a tumour, in assays to determine piological activity, to target drugs to a tumour, in assays to determine piological activity for target drugs to a tumour, in assays to determine piological activity. Corrase antibodies/elicit an immune response, to determine quantitative promoting of disorders, stem cell disorders, regenerating bone, carrilage, tendon, discentiation and survival of stem cells, as a characterial elements. Promoting contraceptive, treating osteoporosis and osteoarthritis, amagemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               stroke, immune deficiencies resulting from bacterial, viral or

RESULT
```

The invention relates to isolated prostate-specific polypeptides, antibodies raised against the polypeptides (or antigenic epitopes antibodies raised against the polypeptides (or antigenic epitopes) derived from them) and antigen presenting cells expressing the polypeptides. The antibodies are useful for detecting the presence of the antigen-presenting cells are useful for stimulating and/or expanding of cancer especially prostate cancer. The polypeptides, polynucleotides and cancer especially prostate cancer. Compositions comprising the development polynucleotide and/or polypeptide are useful for stimulating and manne polynucleotide and/or polypeptide are useful for stimulating an immune response, and for treating cancer. The oligonucleotide is useful for molecule raised against a prostate specific polypeptide of the invention.

                                                                                                                                                                                    The present invention describes polynucleotide sequences (I) which encode prostate-specific proteins (II). (I) and (II) have cytostatic activity, and can be used in vaccine production and gene therapy. (I), (II), and can be used in vaccine proteins comprising (II), and isolated can expected using (I) or (II) are used treat cancer in a patient. The cancer that is diagnosed or treated is particularly patient. The cancer that is diagnosed or treated is particularly compressed for monitoring the progression of cancer in a patient. (I) and (II) can be used in vaccines. The antibodies or prostate cancer. They can indicate the level of metastasis compethods for prostate cancer. They can indicate the level of metastasis as well as the prostate volume. Ashignshy to Ashignshy and AshOllis to as well as the prostate volume. Ashignshy and anino acid sequences used in the cancer invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        5

The invention relates to isolated lung tumour-specific proteins and their corresponding cDNA molecules. Lung tumour-specific proteins and their antigen-presenting cells are useful for stimulating and/or expanding T cells specific for a tumour protein, and for inhibiting useful for stimulating an invention also relates to a composition useful for stimulating an immune response, and for treating cancer. The lung tumour specific oligonucleotide is useful in gene therapy and for lung tumour specific oligonucleotide is useful in gene therapy and for as a cDNA encoding human lung tumour-specific T cell receptor alpha
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Lodes MJ, Mohamath R, Secrist H, Benson DR, Indirias CY; RA, Fling SR, Algate PA, Elliot M, Mannion J, Kalos MD;

                                                                                                                                                                                                                                                      constant region. The protein is an immunosupressant which is not antigen-specific and suppresses both humoral and cell -mediated immune reactions. It can be used for treatment and/or prevention of delayed hypersensitivity reactions, allergies and autoimmune reactions, and inhibition of transplant rejection. The protein does not induce the formation of antibodies against them to any significant extent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  382 ATCCAGAACCCTGACCCTGCCGTGTACCAGCTGAGACTCTAAATCCAGTGACAAGTCT 441
